CLAIMS

- 1. A composing method for composing a data compartment aggregation packet frame comprising:
- generating a plurality of data compartments, each having a compartment identifier, an MSDU and a compartment FCS;

combining the data compartments to define a data carriage;
generating a carriage header to be located in front of the
data carriage to define a carriage;

generating a MAC header to be located in front of the carriage, said MAC header including a portion allocated with a unique bit pattern; and

generating a frame FCS for error detection in the MAC header and the carriage.

- 15 2. A composing method of claim 1, wherein said carriage header includes a compartment count indicating the number of data compartments, a compartment length information indicating the length of each of the data compartment and a header FCS.
- 3. A composing method of claim 1, wherein said compartment identifier includes only a compartment sequence control number.
 - 4. A composing method of claim 1, wherein said compartment identifier includes only a flow identifier and a compartment sequence control number.
- A composing method of claim 1, wherein said compartment
 identifier includes only a compartment recipient address, and a compartment sequence control number.
 - 6. A composing method of claim 1, wherein said compartment

identifier includes only a compartment recipient address, a flow identifier and compartment sequence control number.

- 7. A composing method of claim 1, wherein said compartment identifier includes a MAC header.
- 5 8. A composing apparatus for composing a data compartment aggregation packet frame comprising:

means for generating one or more data compartments, each having a compartment identifier, an MSDU and a compartment FCS;

means for combining the data compartments to define a data carriage;

means for generating a carriage header to be located in front of the data carriage to define a carriage;

means for generating a MAC header to be located in front of the carriage, said MAC header including a portion allocated with a unique bit pattern; and

15

25

means for generating a frame FCS for error detection in the MAC header and the carriage.

- 9. A composing apparatus of claim 8, wherein said carriage header includes a compartment count indicating the number of data compartments, a compartment length information indicating the length of each of the data compartment and a header FCS.
 - 10. A composing apparatus of claim 8, wherein said compartment identifier includes only a compartment sequence control number.
 - 11. A composing apparatus of claim 8, wherein said compartment identifier includes only a flow identifier and a

compartment sequence control number.

- 12. A composing apparatus of claim 8, wherein said compartment identifier includes only a compartment recipient address, and a compartment sequence control number.
- 5 13. A composing apparatus of claim 8, wherein said compartment identifier includes only a compartment recipient address, a flow identifier and compartment sequence control number.
- 14. A composing apparatus of claim 8, wherein said compartment identifier includes a MAC header.
 - 15. A decomposing method for decomposing a data compartment aggregation packet frame having a MAC header, carriage header and a plurality of data compartments, said decomposing method comprising:
- detecting a unique bit pattern located in a MAC header;
 separating data compartments; and
 processing the data compartments.

20

25

16. A decomposing apparatus for decomposing a data compartment aggregation packet frame having a MAC header, carriage header and a plurality of data compartments, said decomposing apparatus comprising:

means for detecting a unique bit pattern located in a MAC header:

means for separating data compartments; and means for processing the data compartments.

17. A computer readable data compartment aggregation packet frame comprising:

- a plurality of data compartments, each having a compartment identifier, an MSDU and a compartment FCS, said data compartments being aligned to define a data carriage;
- a carriage header located in front of the data carriage to define a carriage;
 - a MAC header located in front of the carriage, said MAC header including a portion allocated with a unique bit pattern; and
 - a frame FCS for error detection in the MAC header and the carriage.
- 18. A computer readable data compartment aggregation packet frame of claim 17, wherein said carriage header includes a compartment count indicating the number of data compartments, a compartment length information indicating the length of each of the data compartment and a header FCS.
- 15 19. A computer readable data compartment aggregation packet frame of claim 17, wherein said compartment identifier includes only a compartment sequence control number.
 - 20. A computer readable data compartment aggregation packet frame of claim 17, wherein said compartment identifier includes only a flow identifier and a compartment sequence control number.

20

25

- 21. A computer readable data compartment aggregation packet frame of claim 17, wherein said compartment identifier includes only a compartment recipient address, and a compartment sequence control number.
- 22. A computer readable data compartment aggregation packet frame of claim 17, wherein said compartment identifier includes

only a compartment recipient address, a flow identifier and compartment sequence control number.

23. A computer readable data compartment aggregation packet frame of claim 17, wherein said compartment identifier includes a MAC header.
